

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is actually a hydraulic apparatus that can allow the individual driving to be able to operate the lift truck without leaving the seat. They are made out of high quality materials and are designed to withstand the most difficult procedures and work surroundings. Side shifting units have the extra ability to be able to laterally position the entire load or the arms so as to facilitate much more precise lifting and placement in a faster and much more efficient manner.

The only one of its kind fork pocket design could enable the one operating it to be able to securely swing the unit's blades without any worry of destroying the positioning cylinders. This could allow the operator the choice to either execute simultaneous or independent blade movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into fork positioners on existing units.
